```
The invention relates to a protein kinase polypeptide (I), BAA34445.1, and the encoding polynuclectide (II). (I) is useful as a protein kinase and the encoding polynuclectide (II). (I) is useful as a protein kinase are coll-cell adhesion. (II) is useful in therapy or diagnosis of disease and for treatment of neoplasm e.g. melanoma, lung, colorectal, breast, pancreas, head and neck and other solid tumours, myeloproliferative disorder, such as leukaemia, non-Hodgkin lymphoma, leukopenia, thrombocytopenia, angiogenesis disorder, Kaposi's sarcoma, inflammation, desease, such as allergy, inflammatory bowel disease, authritis, psoriasis and respiratory tract inflammation, aschma, organ transplantation, cardiovascular disease, bypertension, oedema, angina, entral nervous system disease, including Alzhainer's disease, brain injury and amyotrophic lateral sclerosis, pain, renal disease, brain injury and amyotrophic lateral sclerosis, pain, renal disease, diabetes mellitus, osteoporosis, AIDS, viral infection, bacterial infection, fungal infection and parasitic infection. ABK93911-ABK93949 represent protein kinase coding sequences and related expressed sequence tags of the invention
                                                                                                               mumani processi. Homo sapiens.

```
The invention relates to a protein kinase polypeptide (I), BAA34445.1,
and the encoding polynucleotide (II). (I) is useful as a protein kinase
and tor effecting cell-cell adhesion. (II) is useful for expressing a
protein with kinase activity. (I) and (II) are useful in therapy or
diagnosis of disease and for treatment of neoplasm e.g. melanoma, lung,
colorectal, breast, pancreas, head and neck and other solid uncours,
myeloproliferative disorder, such as leukaemia, non-Hodgkin lymphoma,
leukopenia, thrombocytopenia, angiogenesis disorder, Kaposi's Sarcoma,
inflammatory disease, such as allergy, inflammatory bowel disease,
autoimmune disease, arthitis, psoriasis and respiratory tract
inflammation, oedema, angina, atheroselerosis, thrombosis, sepsis, shock,
repertusion injury, ischaemia, central nervous system disease, including
Alzheimer's disease, brain injury and amyotrophic lateral sclerosis,
capin, renal disease, diabetes mellitus, osteoporosis, AIDS, viral
infection, bacterial infection, fungal infection and parasitic infection.
ABK93911-ABK87919 represent to the protein kinase coding sequences and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a protein kinase polypeptide (I), BAA34445.1,
and the encoding polynucleotide (II). (I) is useful as a protein kinase
and the encoding polynucleotide (II). (I) is useful as a protein kinase
and for effecting cell-cell adhesion. (II) is useful in therapy or
diagnosis of disease and for treatment of neoplasm e.g. melanoma, lung,
colorectal, breast, pancreas, head and neck and other solid tumours,
myeloproliferative disorder, such as leukaemia, non-Hodgkin lymphoma,
leukopenia, thrombocytopenia, angiogenesis disorder, Kaposi's sarcoma,
inflammatory disease, such as allergy, inflammatory bowel disease,
inflammation, asthma, organ transplantation, cardiovascular disease,
inflammation, oedema, angina, atherosolerosis, thrombosis, sepsis, shock,
reperfusion injury, ischaemia, central nervous system disease, including
Alzheimer's disease, brain injury and amyotrophic lateral sclerosis,
pain, renal disease, brain injury and amyotrophic lateral sclerosis,
pain, renal disease, brain injury and amyotrophic lateral sclerosis,
infection, bacterial infection, fungal infection and parasitic infection.
ARK93911-ABK3394 represent protein kinase coding sequences and related
expressed sequence tags of the invention

The invention describes an isolated human pyridoxal (pyridoxine, vitamin B6) Kinase, (PDXK) polynucleotide. The polynucleotide is useful in studying the expression and function of PDXK, and in expressing PDXK protein for use in screening for candidate drugs to treat PDXK related diseases and for therapeutic purposes. A transgenic animal is useful for studying expression of the PDXK isogenes in vivo, for in vivo screening and testing of drugs targeted against PDXK protein, and for testing the efficacy of therapeutic agents and compounds for autoimmune polyplandular disease type I. The polypeptide is useful for studying the effect of the variation on the biological activity of PDXK and the binding affinity of candidate drugs targeting PDXK for the treatment of autoimmune polyglandular disease type I. Genotyping and haplotyping is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with PDXK as a candidate agent for treating diseases type I, to validate PDXK as a candidate agent for treating a specific condition or disease clinical trials of candidate drugs. This sequence is one of 38 (see ABK16978-ABK17015) primers used for detecting PDXK gene polymorphisms by primer extension texminates, described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated human pyridoxal (pyridoxine, vitamin B6) kinase polyNts, useful for therapeutic purposes, for studying the expression and function of the polyNt, and for expressing pyridoxal protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ·

The present invention provides the protein, gene and cDNA sequences of human colony stimulating factor 3(granulocyte) CSF3. Also described are single nucleotide polymorphisms (SNPs) identified within these sequences. The sequences can be used in the treatment of neutropenia, promyelocytic leukaemia and haematological disorders. The present sequence is an allele specific primer extension oligonucleotide used to isolate the coding
                                                                                                                      Human; colony stimulating factor 3(granulocyte); CSF3; SNP; isogene; chromosome 17q11-12; single nucleotide polymorphism; immunostimulant; neutropenia; promyelocytic leukaemia; haematological disorder; gene therapy; PCR; primer extension oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                               New variants of colony stimulating factor 3 (CSF3) isogenes, useful fimproving efficiency and reliability in the development of drugs for treating diseases associated with CSF3 activity e.g. neutropenia.
                                                                                         Human CSF3 gene allele specific primer extension oligo SEQ ID NO: 40.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zinc finger protein related oligonucleotide target SEQ ID NO:567

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) can careful site, comprising a first (FI), a second (F2), and a third (F3) careful site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (CI) comprising (I), (2) a polymudeotide (III) encoding (I) or (III); and (CI) designing (I), involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it compared to the S2 target subsite, and selecting the F3 zinc finger such that it compared to the S3 target subsite, thus designing (I) that binds to the S2 target subsite, thus designing (I) that binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplic target subsites (CI) that binds to useful in studying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in clinger the expression of a target region within a subject, in clinger such and in assays to determined the phenotype and function of in a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity. ABG71213 to ABG72214 and ABB73230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                        New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Zinc finger protein related oligonucleotide target SEQ ID NO:568.

The present invention describes a zinc finger protein (1) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) and a third (F3) that chinger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (M) (1) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, thus designing (I) that binds to the S2 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and the subsite of a target function of target target target subsites that the subsite of a target function, and for human therapeutic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of a farget sequences and zinc target sequences and zinc finger peptides which are given in the exemplification of the present
                                                                                                       New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IRES; internal ribosome entry site; viral protein synthesis inhibition; viral replication inhibition; viral infection; virucide; IIIc loop; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatitis C virus internal ribosome entry site, IRES, IIIc loop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          37.0%; Score 7.4; DB 1; Length 10; 88.9%; Pred. The present invention relates to a method for screening for a recombinant polypeptide, which contains at least one mutant RNA recognition motif (mRR) for binding to an internal ribosome entry site (TRS), or one of its domains. The recombinant polypeptide inhibits viral proteins synthesis (and thus viral replication) in vivo and in viro, by binding to its in competition with cellular or viral proteins that normally bind to it. Recombinant polypeptides identified by the invention are useful for treatment or prevention of viral infection in which the replication cycle includes a CAP-independent translation of an RNA sequence, appecifically hepatitis C virus, but also bovine/calf/human diarrhoea viruses swine pest, piglet transmissible gastro-enteritis, foot-andmouth disease, hepatitis A murine hepatitis, common cold virus or avian Hepatitis. The present sequence is the IIIc loop of the IRBS from Hepatitis C virus, which was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                              Screening for polypeptide having mutant RNA recognition site, useful for controlling viral infections, especially hepatitis C, by binding to internal ribosome entry site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to SAGE (serial analysis of gene expression) tags
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful for the

representing 171 genes which are more highly expressed in Th1 cells compared with Th2 cells

Sequence 10 BP; 2 A; 2 C; 3 G; 3 T; 0 U; 0 Other;

ន្តដូល

```
representing groups of genes which are expressed in activated human Thi and/or Th2 cells. The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CATG-3' sequence motify lying nearest to the polyA region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in Th1 and/or Th2 cells, antibodies against these proteins, and inhibitors of the expression of groups of genes that are expressed in either or both the two cell types. Groups of genes that are expressed in and/or Th2 cell types may be used for the diagnosis and treatment of Th1 and Th2 cells disorders. Sequences ABV78390-ABV78560 are SACE tags compared with Th2 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human activated Th1 and Th2 cell expression gene group, useful for the diagnosis and treatment of Th1 and Th2-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SAGE tag; serial analysis of gene expression; human; Th1 cell; activated T cell; T lymphocyte; immune response; expression pattern; preferential expression; immune disorder; EST; expressed sequence tag;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human Th1 cell preferentially expressed EST SAGE tag, SEQ ID NO:217.

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chronic hepatitis C (CH) liver tissue or hepatitis C-induced hepaticis C (CH) liver tissue or hepatitis C-induced hepatocellular carcinoma (HCC) compared with normal human liver tissue.

The SAGE tags of this invention consist of a sequence of 10 mucleotides consist of a sequence of 10 mucleotides consist of a sequence of 10 mucleotides consist of the SAGE tags of this invention consist of a sequence of 10 mucleotides consist of the SAGE tags of this invention consist of genes. These tags serve polya region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the construction of consist of the expression in particular cell types. The invention also crelates to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the chronic hepatitis C tissue or HCC may be used for the diagnosis and crivity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ABV94691ABV84700 are SAGE tags representing the 100 least highly expressed genes which are underexpressed in hepatocellular carcinoma compared with chronic hepatitis C liver tissue hepatocellular carcinoma compared with chronic hepatitis C liver tissue

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are expressed in activated human Thi and/or Tha cells. The SAGE tags of this invention consist of a sequence of IO nucleotides located downstream of the 3-CATG-3' sequence motiflying nearest to the polya region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in Thi and/or Th2 cells, antibodies against these proteins, and inhibitors of the expression of groups of genes that are expressed in either or both the two cell types. Groups of genes expressed in Thi and/or Th2 cell types may be used for the diagnosis and treatment of Thi and /12-related disorders. Sequences ABV78390-ABV78560 are SAGE tags

                                                                                                       12-DEC-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
  The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chronic hepatitis C (CH) liver tissue or hepatitis C induced human liver tissue.

The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the S'-CATG-3' sequence motif lying nearest to the polyA region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the polyA region of cDNAs derived from a variety of genes. The invention also relates to proteins encoded by the genes expressed in chronic hepatitis of liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of genes that are overexpressed in chronic hepatitis C liver tissue or HCC may be used for the diagnosis and in chronic hepatitis C liver tissue or HCC may be used for the diagnosis and creatment of these diseases. Such genes inhibitors of their expression or activity, and antibodies against the spen products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ABV84691-ABV84790 are SAGE tags representing the 100 least highly expressed genes out of those genes which are underexpressed in hepatocellular carcinoma compared with chronic hepatitis C liver tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chronic hepatitis C (CH) liver tissue or hepatitis C-induced in human liver tissue.

The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif lying nearest to the polyA region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in chronic hepatitis C invertissue or HCC, antibodies against these proteins, and inhibitors of the expression of genes that are overexpressed in chronic hepatitis C liver tissue or HCC. Groups of genes differentially expressed in chronic hepatitis C tissue or HCC. Groups of genes differentially expression or activity, and antibodies against the gene products may be used in the expression or activity, and antibodies against the gene products may be used in the expression or activity, and antibodies against the gene products may be used in the expression or activity of drugs to treat chronic hepatitis C and/or HCC. Sequences ABV94291-ABV84390 are SAGE tags representing the low least highly expressed genes out of those genes which are underexpressed in chronic expressed genes out of those genes which are underexpressed in chronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chronic hepatitis C (CH) liver tissue or hepatitis C -induced human liver tissue.

The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the S'-CATG-3' sequence motif lying nearest to the polyh region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in chronic hepatitis of liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes there are overexpressed in chronic hepatitis C liver tissue or HCC frowps of genes differentially expressed in chronic hepatitis C tissue or HCC may be used for the diagnosis and chronic hepatitis C tissue or HCC may be used for the diagnosis and creativity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC Sequences Appressed genes out of those genes which are underexpressed in the expressed genes out of those genes with normal liver tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC; expression pattern; differential expression; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chronic hepatitis C/HCC differentially expressed gene SAGE tag #574.
                                                                                                                                                                                                                                                                                                                                     Human chronic hepatitis C tissue expression exasperating gene group comprises 100 high-ranking genes.

The invention relates to SAGE (serial analysis of gen. expression) tags representing groups of genes which are differentially expressed in human chronic hepatitis C (CM) liver tissue or hepatitis C-induced in human liver tissue.

The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the S-CATG-3' sequence motifilying nearest to the collected downstream of the S-CATG-3' sequence motifilying nearest to the polya region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in chronic hepatitis of liver tissue or HCC, antibodies against these proteins, and inhibitors of hepatitis C liver tissue or HCC. Groups of genes that are overexpressed in Chronic hepatitis C tissue or HCC may be used for the diagnosis and creatment of these diseases. Such genes, inhibitors of their expression or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ABV848611-ABV84790 are SAGE tags representing the loo least highly expressed genes out of those genes which are underexpressed in hepatocellular carcinoma compared with chronic hepatitis C liver tissue hepatocellular carcinoma compared with chronic hepatitis C liver tissue ö SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC; Gaps Human chronic hepatitis C tissue expression exasperating gene group comprises 100 high-ranking genes. ö 37.0%; Score 7.4; DB 1; Length 10; 88.9%; Pred. chronic hepatitis C (CH) liver tissue or hepatitis C-induced
hepatocellular carcinoma (HCC) compared with normal human liver tissue.
The SAGE tags of this invention consist of a sequence of 10 nucleotides
located downstream of the 5'-CANG-3' sequence motif lying nearest to the
polya region of cDNAs derived from a variety of genes. These tags serve
to uniquely lidentify each transcript and can thus be used to analyse the
pattern of gene expression in particular cell types. The invention also
relates to proteins encoded by the genes expressed in chronic hepatitis C
liver tissue or HCC. Antibodies against these proteins, and inhibitors of
the expression of groups of genes that are overexpressed in chronic
hepatitis C liver tissue or HCC. Groups of genes differentially expression
c no farronic hepatitis C tissue or HCC may be used for the diagnosis and
treatment of these diseases. Such genes inhibitors of their expression
or activity, and antibodies against the gene products may be used in the
development of drugs to treat chronic hepatitis C and/or HCC. Sequences
ABV84691-ABV84790 are SAGE tags representing the 100 Least highly
expressed genes out of those genes which are underexpressed in
hepatocellular carcinoma compared with chronic hepatitis C liver tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC; expression pattern; differential expression; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to SAGE (serial analysis of gen3 expression) tags representing groups of genes which are differentially expressed in human chronic hepatitis C (CH3) liver tissue or hepatitis C ...induced hepatocellular carcinoma (HCC) compared with normal human liver tissue. The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CAIG-3' sequence motif lying nearest to the polya region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in chronic hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes that are overexpressed in chronic hepatitis C liver tissue or HCC. Groups of genes differentially expressed in chronic hepatitis C tissue or HCC may be used for the diagnosis and chromic hepatitis C tissue or HCC may be used for the diagnosis and readment of these diseases. Such genes, inhibitors of thair expression or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences expressed genes out of those genes which are overexpressed in hepatocellular carcinoma compared with chronic hepatitis C liver tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human Ran GTPase activating protein 1 (RANGAPI) gene located on chromosome 2243.2-43.31, and methods for haplotyping and/or genotyping the RANGAPI gene. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the RANGAPI gene polymorphisms. The polymorpheotides and screened compounds are useful for treatment of diseases associated with RANGAPI activity, such as cancer and other disorders associated with an irregular cell cycle, AAS19821-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, single nucleotide polymorphism, SNP, RANGAP1,

The invention relates to an isolated polynucleotide comprising a sequence selected from a polymorphic variant of calmodulin 1 (CALMI). The polymorphic variant comprises an CALMI isogene defined by a haplotype selected from haplotypes 1-21 given in the specification. The polymorphisms are useful for studying the biological function of CALMI as the identifying drugs targeting this protein for the treatment of a disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for the treatment of targeting CALMI to treat a specific condition or disease predicted to be associated with CALMI activity. Steablishing CALMI haplotype or haplotype pair of an individual is useful for improving the efficiency and relability of several steps in the discovery and development of drugs clibability of several steps in the discovery and development of drugs disease and diseases involving defects in calcium-dependent signal transduction. Haplotyping the CALMI gene in an individual is also useful the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with CALMI activity, ASSSS892-AASSG018 represent human CALMI alleje- specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in expressing CALM1 protein for use in screening for candidate drugs to treat diseases related to CALM1 activity such as Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

New genetic variants of smoothened Drosophila homolog (SMOH) gene useful for therapeutic purposes and for expressing SMOH protein useful in identifying drugs to treat basal cell carcinomas.

Sausker EA;

Lee HH,

The invention relates to an isolated polymuclectide comprising a sequence which is a polymorphic variant of a reference sequence for the human emothered Diosophila homologue (SMOH) gene or its fragment, or a polymorphic variant of a reference sequence for a SMOH CDNA or its fragment. A new isolated polypeptide is useful for identifying an association between a trait such as a clinical response to a drug targeting the polypeptide. A new method is useful for identifying an association between a trait such as a clinical response to a drug targeting SMOH and a haplotype or haplotype pair of SMOH gene. The methods have applicability in developing diagnostic tests and therapeutic treatments for basal cell carcinomas (BCCs). The isolated polymucleotide is useful for studying the expression and function of SMOH and expressing SMOH protein for use in screening for candidate drugs to treat diseases related to SMOH activity. The polymorphism and haplotype do treat BCCs, screening for the drugs and reducing bias in clinical trials of the screening for the drugs and reducing bias in clinical trials of the screening for the drugs and reducing bias in clinical trials of the for determining whether an individual has one of the haplotypes or the treat disorders by gene therapy and antisense gene therapy. This continue sequence represents a primer used for detecting human smoothened Drosophila homologue gene polymorphisms of the invention

perecting colorectal cancer in a subject, involves derecting macrophage inhibitory cytokine or renal dipeptidase or their mRNA in feces or blood of the subject.

Disclosure; Page 28; 59pp; English.

The invention relates to detecting macrophage inhibitory cycuckine (MIC) adenoma), comprising: (a) detecting macrophage inhibitory cycuckine (MIC) or renal dispetidase (RDP) in faces or blood of a subject and comparing amount of MIC or RDP detected to that in normal subjects, where an elevated amount of MIC or RDP mRNA in the mRNA sample, and comparing amount of MIC or RDP mRNA in the subject is an indicator of CC in control faces of a subject, (c) and indicator of CC in subject, (b) isolating mRNA sample, and comparing the amount of MIC or RDP mRNA in the subject is an indicator of CC in subject, (c) ample to mRNA ample, and comparing the amount of MIC or RDP mRNA ample to amounts of MIC or RDP mRNA sample to amount of MIC or RDP mRNA in normal subjects, where on a blood or faces of a subject or epithelial cells, detecting an mRNA sample to amount of MIC or RDP mRNA in normal subjects, where or cc in the subject; (d) contacting blood or faces of a subject, with an RDP substrate, detecting activity of RDP in the blood or faces by a detection of increased reaction product or decreased RDP substrate, and comparing the amount of activity of RDP in the blood or faces by detection of increased reaction product or decreased RDP substrate, and comparing the amount of activity of RDP in the blood or faces by contact to that in normal subject; where an elevated amount of activity of RDP in the blood or faces of the subject is an indicator of CC in the subject; (e) administering to a subject and antibody which specifically contact to RDP or an inhibitor of RDP, where the antibody or inhibitor is labeled with a moiety which is detectable from outside of the subject and cercased contact a substrate for RDP, the subject and outside of the subject was a product or decreased with the detectable moiety, where increased product or decreased with the detectable moiety, where increased product or decreased with the detectable moiety, where increased product or decreased with the detectable moiety, where increased product or decre

The invention relates to detecting CC (colorectal cancer e.g. colorectal adenoma), comprising: (a) detecting macrophage inhibitory cytckine (MIC) or renal dipeptidase (RDP) in faces or blood of a subject and comparing camount of MIC or RDP detected to that in normal subjects, where an elevated amount of MIC or RDP in the subject is an indicator of CC in subject; (b) isolating mRNA sample from facese of a subject, detecting MIC or RDP mRNA in the mRNA sample, and comparing amount of MIC or RDP mRNA in the subject is an indicator of CC in subject; (c) ror RDP mRNA in the subject is an indicator of CC in subject; (c) isolating epithelial cells from blood of a subject; isolating an mRNA sample from faces of a subject or epithelial cells, detecting MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in che mRNA sample from MIC or RDP mRNA in the mRNA sample to amounts of MIC or RDP mRNA in normal subjects, where an elevated amount of MIC or RDP mRNA in the mRNA sample is an indicative of CI in the subject; (d) contacting blood or facese of a subject, with an RDP substrate, detecting activity of RDP in the blood or facese by detection of increased reaction product or decreased RDP substrate, and
                                                                                                                                                                                                                                                          ö
detectable moiety, isolating faeces or blood from the subject, and detecting in the faeces or blood RDP reaction product or RDP substrate with the detectable moiety, where increased product or decreased substrate in the faeces or blood indicates CC in the subject. The methods are useful for detecting colorectal cancer in a subject. The present sequence is a DNA tag derived from a human transcript whose expression is repressed in colorectal cancer or colorectal adenoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting colorectal cancer in a subject, involves detecting macrophage inhibitory cytokine or renal dipeptidase or their mRNA in feces or blood of the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Colorectal cancer; colorectal adenoma; ss; human; renal dipeptidase; macrophage inhibitory cytokine; MIC; RDP; faeces; blood; kidney proximal tubule.

comparing the amount of activity of RDP in blood or faeces of the subject to that in normal subjects, where an elevated amount of activity of RDP in the blood or faeces of the subject is an indicator of CC in the subject; (e) administering to a subject an antibody which specifically binds to RDP or an inhibitor of RDP, where the antibody or inhibitor is labeled with a moiety which is detectable from outside of the subject and area of localisation of the moiety within the subject but outside the proximal tubules of the kidney identifies CC; or (f) administering to a subject a substrate for RDP, the substrate being labeled with a detectable moiety, isolating faeces or blood from the subject, and detectable moiety, where increased product or RDP substrate with the detectable moiety, where increased product or RDP substrate with the detectable moiety, where increased product or RDP substrate of the subject in the faeces or blood indicates CC in the subject. The methods are useful for detecting colorectal cancer in a subject. The present substrate is a DRA tag derived from a human transcript whose expression is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.
for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

New gene encoding a protein having ethanolaminephosphate cytidyltransferase activity, useful for treating Zellweger's syndrome, or lipid-related diseases such as cardiovascular diseases and obesity.
                                                                                                                                                                                                                                                                                                     The invention relates to a mouse gene encoding a protein having ethanolaminephosphate cytidyltransferase (ET) activity appearing as ADD71226, a degenerate variant of the ET gene, or a Sequence that hybridises to the complement of the ET gene under stringent conditions. Also included is a promoter of a human ethanolaminephosphate cytidyltransferase gene appearing as ADD71227. The gene and promoter are useful for producing a transgenic animal, and for idertifying, preventing, and treating diseases (by gene therapy) related to inappropriate phosphatidylethanolamine production, e.g. Zellweger's syndrome, or lipid-related diseases such as cardiovascular diseases, atherosclerosis and obesity. The present sequence is a mouse ET gene 3' splice acceptor site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New mammalian model for enhanced wound healing - useful for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Wound healing, non-MRL healer mouse, quantitative trait locus, QTL, healing response, microsatellite marker, treatment, central nerve, peripheral nerve, nerve injury, SAGE tag; murine; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel monobactam compounds. A compound of the invention has antibacterial activity, and acts as a PBP2a inhibitor. The compounds are used as antibacterial agents. The monobactam compounds restore sensitivity of methicillin resistant Staphylococcus aureus to lactam antibiotic by targeting the molecular mechanism of resistance. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse, ethenolaminephosphate cytidilyl transferase, ET; ds;

This invention describes a novel non-WRL healer mouse (W) having at least one quantitative trait locus selected from those given in the specification, exhibiting an enhanced healing response to a wound compared to mice (W) without the locus. The invention describes a novel method of identifying agene involved in enhanced wound healing by identifying DNA microsatellite markers which and identifying microsatellite markers which sergegate with enhanced wound healing in progeny of the mice, where a chromosomal locus containing at least one enhanced wound healing gene is identified. A method of treating a wound; a mammal is also disclosed. The new methods are useful for treating wounds, especially central and periods function after nerve injury in a mammal. (M) is useful as a mammalian model of enhanced wound healing, useful for identifying genes and per products involved in enhanced wound healing, and to provide methods for wound healing. Asialogic represent murine SAGE tags from C57BL/6 and MRL mice which are used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mammalian model for enhanced wound healing - useful for identifying

This invention describes a novel non-MRL healer mouse (M) having at least one quantitative trait locus selected from those given in the

Claim 13; Page 57; 136pp; English.

```
specification, exhibiting an enhanced healing response to a wound compared to mice (m) without the locus. The invention describes a novel method of identifying a gene involved in enhanced wound healing by identifying a gene involved in enhanced wound healing by identifying DNA microsatellite markers which from non-healer mice and identifying microsatellite markers which sepregate with enhanced wound healing in progeny of the mice, where a chromosomal locus containing at least one enhanced wound healing gene is identified. A method of treating a wound in a mammal is also disclosed. The new methods are useful for treating wounds, especially central and peripheral nerve wound. The methods of the invention are useful for restoring function after nerve injury in a mammal. (M) is useful as a mammalian model of enhanced wound healing, useful for identifying genes methods for wound healing. AAZI8691-Z19036 represent murine SAGE tags from C57BL/6 and MRL mice which are used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential useful for, (A) comprises protein or mRNAs or their fragments, (M1) is useful for; identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from voung and aged skin, to identify that genes that show strong differential expression. (A) comprises protein or mRNAMs or their fragments. (M1) is useful for: identifying maxkers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene

The invention relates to identifying (MI) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential useful for. (A) comprises protein or mRNAM or their fragments. (MI) is useful for: identifying markers of skin ageing and/or stress; and identifying or determining the effects of skin ageing and/or stress; and identifying or determining the effects of sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQB6246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and aging, useful e.g. in its, based or differential

                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to identifying (MI) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by scrial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential expression. (A) comprises protein or mRNAS or their fragments. (MI) is useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharamecutical or cosmetric agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention
                                                                                                                                                                                                                                              Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

(SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis or promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or ichthyosis, specifically neurodermatitis; sunburn; psoriatis scleroderma; ichthyosis; atopic dermaritis; acne; seborrhea; lupus erythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or ichthyosis; atopic dermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; inchthyosis, atopby dermatitis, acne, sebornhea; lupus expresseds income, sebornhea; lupus expresseds skin rosacea, melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene aypression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or ichthyosis; specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhaz; lupus arythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression ($AGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; subburn; psoriasis; scleroderma;
                                                                                                                                                                                                                     In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhasic; immunosuppressive; antiinflammatory; cytostatic; SAGE; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

                                                                                                                            The invention relates to in vitro identification (W1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psociatis scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinom; or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(MI) is useful for identifying genes involved in skin homeostasis; to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.

promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; chthyosis, atopic dermatitis; acne; seborrhea; lupus exythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarroom of the skin. The present sequence is that of a human expressed sequence tag (BST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(MI) is useful for identifying genes involved in skin homeostasis; to bromotes skin homeostasis and to teet agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; cosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixtune of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus crythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (BSI) of the invention
                                                                                                                                                                                                                              Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST, expressed sequence tag, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

```
The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; pscriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; ichthyosis; melanoma; basal cell carcinoma; and carcinoma; or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sumburn; psoriasis; scleroderma; icthhyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis, to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis, acne, seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the
                                                    The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from Skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agant (A) that maintains or promotes skin homeostasis or that can be used for treating skin disordders, specifically neurodermatitis; sumburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (MI) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; besai cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression. (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for traiting skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermaitis; acne; seborrhes; lupus erythematosus; rosaces, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                 In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression. ($AGE$) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sumburn, psorias; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.

Hofmann K;

Disclosure; Page 171; 1345pp; German

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to the can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborntea; lupus expthematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis, to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or ichthyosis, specifically neurodermatitis, sumburn, psoriasis, soleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriatis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; mouse; rat; TEM; tumour endothelial marker; NEM; PEM; cytostatic; normal endothelial marker; immunostimulant; antiangiogenic; tumour; necoangiogenesis; vascularised tumour; polycystic kidney disease; diabetes; retinopathy; rheumatoid arthritis;
                                                                                                                                                                                                      In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             37.0%; Score 7.4; DB 1; Length 11; 88.9%; Pred. ```
The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740, ABB90750 and ABB90769. The antibodies which bind to TEM proteins have cytostatic, immunostimulant and antiangiogenic activity. They are useful for inhibiting tumour growth, neoangiogenesis in subjects bearing a vascularised tumour, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis and psoriasis. Human, mouse and rat TEM genes and the encoded proteins (ABB92075-ABB921141 and ABB90721-ABB90789) are disclosed, as are marker oligonucleotide sequences: tumour endothelial markers (TEM) ABL92041 and ABB92143-ABB92191; normal endothelial markers (NEM) ABL92041, and pan-endothelial markers (NEM) ABL92041, and pan-endothelial markers oligonucleotide sequence is that of an oligonucleotide marker useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    p53 protein, pGL3 luciferase reporter vector, luc+, transcription factor, cell cycle control; DNA damage repair; pGL3 basic vector; apoptosis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining the p53 status of a sample, useful for assaying for mimetics or antagonists of p53, or for the presence of DNA damage, comprises determining whether p53 binds to the pGL3 vector in a sample containing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            patent discloses methods for determining the p53 status of a sample
                                                                      An isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tunor endothelial marker (TEM) protein, useful for inhibiting tumor growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

which comprise providing a sample containing a pGL3 luciferase reporter vector and determining whether p53 binds to the pGL3 vector. p53 is a transcription factor that regulates many genes including those associated with call cycle control, apoptoals and DNA damage repair. pGL3 reporter vectors contain a modified firefly luciferase cDNA designated luc+. p53 protein binds to pGL3-basic vector and causes luciferase expression. The method is useful for determining the p53 status of a sample. It is also useful for assaying for mimetics or antagonists of p53 and for assaying for the method of modifying pGL3 vector which involves deletion or relates to a method of modifying pGL3 vector which involves deletion or alteration of a CCCGGG motif of the pGL3 vector and/or deleting or alterating a sequence incorporating the CCCGGG motif. The nucleic acid having a sequence incorporating the CCCGGG motif is useful for conferring promoter activity or p53-responsiveness on a nucleic acid motificy. The present DNA sequence is pGL3 basic vector CCCGGG motif for conferring breamth of a polypeptide of interest or in assays for p53 transcriptional activity. The present DNA sequence is pGL3 basic vector CCCGGG motif for conferr activity when also also motified motifit to conferr promoter activity.

New purified human transmembrane protein, designated as tumor endothelial marker (TEM) 3, useful for detecting, diagnosing or treating tumors, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis or psoriasis.

Disclosure; Page 89; 374pp; English.

The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in

normal and tumour ECs. Tumour endothelial marker (TEM), normal endothelial marker (WEM) genes are indothelial marker (WEM) genes are identified in human ECs. The human EC marker proteins and the polymucleotide sequences encoding them are useful for detecting, diagnosing or treating tumours as well as polycyptic lidney disease, diabetic retinopathy, rheumatoid arthritis, and psoriasis. They are also useful for inhibiting neoanglogenesis or tumour anglogenesis, for inducing an immune response to tumour endothelial calls in a patient, or for identifying candidate drugs for treating tumours. ABX71828-ABX71899 represent DNA tags for human PEM, TEM or NEM genes 88666666666888888
